

Sanity & NextJS e-commerce store (Intern web case)

Website Case

Objective

Welcome to the exciting assignment of creating a dynamic and polished website using one of our Headless CMS partners, Sanity, together with Next.js! This project will provide you with hands-on experience in integrating content management, dynamic data rendering, and designing a user-friendly website. By the end of this assignment, you will have developed skills in working with one of our common CMSs & Next.js.

If you are completely new to the stack we recommend checking out the course on Udemy first: <https://www.udemy.com/course/nextjs-with-sanity-cms-serverless-blog-app-w-vercel/learn/lecture/20359909>

The Udemy-login is found in the Umain 1password.

Tech Stack:

- NextJS
- Sanity CMS
- Typescript
- Tailwind (recommended)
- ShadCn or Chakra UI (optional UI libraries)
- Zustand state management (optional)

Task

Your task is to use the most recent Sanity/NextJS template and transform it into a fully functional and polished e-commerce website for a small business. The website should be conceptually well-structured and UX friendly, enriched with meaningful content and images relevant to your project idea.

Example of small e-commerce businesses:

- Artwork
- Pet accessories
- Merch print
- Giftshop

Required routes:

1. Landing page. **Route:** /
2. Store/shop (Product listing page): **Route: /store or /shop or /category**
 - a. Relevant Filters: for example:
 - i. Category
 - ii. Color
 - iii. Size
3. Product details page (PDP). **Route (for example): /store/[id]**
 - a. Basic product information
 - i. Title
 - ii. Description
 - iii. Connected category
 - iv. Price
 - v. Add to cart button

Other requirements:

1. Cart (*Saving to local storage is fine for this project*)
2. **Optional** checkout page. This can be as simple as a form, filling in some dummy card details and hitting "Buy" and clearing the local storage

Use

The idea is to be able to use the website you create to showcase examples on how the Headless CMS can be used towards potential clients. Your work including design, CMS admin/studio and content might therefore be showcased in actual live sale presentations.

Instructions

- **Project Setup:**

Begin by cloning the provided GitHub [repository](#) that contains the template for Sanity & NextJS. Familiarize yourself with the directory structure, files, and the basic setup. Follow the

- **Content Modeling:**

Utilize the headless CMS to define a variety of content types relevant to your chosen website concept. Think about what these content types should include - text, images, titles, and any other relevant information.

- **Content Population:**

Populate the content types you've created with realistic and meaningful data. Use actual images and well-written text to emulate a real-world scenario. This will help you grasp how content is structured and displayed. Usage of AI tools is fine for this.

- **Design & Styling:**

Implement a polished design for the website using CSS or a CSS framework of your choice. Your design should be responsive and visually appealing. Pay attention to details like typography, color palette, and spacing.

- **Page Templates & Routing:**

Create templates for each content type. These templates will dictate how individual content items are displayed. Implement routing using Next.js to make sure each content type has a dedicated page.

- **Homepage:**

Devise a captivating homepage that showcases a well-curated selection of content from different categories. You can include a dynamic carousel or slider to feature prominent content.

- **Navigation:**

Design and integrate a user-friendly navigation menu that enables seamless movement between different sections of the website. Make sure users can easily explore all the content.

- **Extra functionality (optional):**

Create a specific feature that suits your project concept. Implement it yourself, through a third-party library or an API.

- **Polishing & Refinement:**

Dedicate time to refine every aspect of your website. This includes optimizing images for faster loading, ensuring consistent styling across all pages, and eliminating any potential bugs.

- **Deployment:**

Once you're satisfied with your website, deploy it to Umain Vercel (Reach out to your mentor for help). This will make your polished super-cool creation accessible online for showcasing.

Submission

Submit your deployed project and github repo to your Mentor when you feel ready

Additionally, include a README file that gives a brief overview of your project, offers setup instructions, and shares any insights you've gained during this process.

Evaluation Criteria:

Your submission will be evaluated based on:

- Successful integration of Sanity and Next.js.
- Accurate and thoughtful content modeling and population.
- The extra functionality and responsiveness.

- Effective implementation of page templates and routing.
- Attention to detail and overall quality of the website.
- Successful deployment of the website.

Note:

Feel free to explore the official documentation of the headless CMS and Next.js, as well as other relevant resources, to enhance your understanding and skills throughout this assignment. Happy coding!
